

SURGICAL PATHOLOGY REPORT FINAL

PATIENT	MRN	DOB	SEX
ROWAN, MAYA	MV000017	11/02/1966	F

Accession	S25-00619
Collected	01/15/2025 09:18
Received	01/15/2025 11:02
Specimen	Liver, segment VIII mass, core biopsy
Ordering provider	Elena Morris, MD

CLINICAL HISTORY

Known left breast invasive carcinoma. Multiple hepatic lesions and sclerotic osseous lesions on staging CT. Biopsy requested for confirmation and receptor assessment.

FINAL DIAGNOSIS

LIVER MASS, CORE BIOPSY: Metastatic carcinoma consistent with breast primary.

BREAST BIOMARKER STUDIES

TEST	RESULT	INTERPRETATION / DETAILS
ER	Positive	90% tumor nuclei; strong intensity
PR	Negative	<1% tumor nuclei
HER2 IHC	Equivocal (2+)	Weak to moderate complete membrane staining
HER2 ISH	Not amplified	HER2/CEP17 ratio 1.5; final HER2 interpretation: negative

COMMENT

Findings support metastatic breast carcinoma. Receptor results on this metastatic specimen differ from the prior breast biopsy with respect to PR expression.

ADDENDUM

HER2 fluorescence in-situ hybridization: NOT AMPLIFIED. HER2/CEP17 ratio 1.5. Final HER2 status: negative.

SURGICAL PATHOLOGY REPORT

Accession	S25-00619
Collected	01/15/2025 09:18
Received	01/15/2025 11:02
Specimen	Liver, segment VIII mass, core biopsy
Ordering provider	Elena Morris, MD

GROSS DESCRIPTION
 Received in formalin labeled liver mass are four tan-brown soft tissue cores, 0.8-1.4 cm in length. Entirely submitted in A1-A2.

MICROSCOPIC DESCRIPTION
 Core biopsies show metastatic adenocarcinoma involving hepatic parenchyma. Tumor cells are positive for GATA3 and pancytokeratin and negative for markers supporting a primary hepatic neoplasm.
