

Medical Oncology - New Patient / Treatment Planning Note

Note Status: Signed

Patient:	Maya Rowan	MRN:	MV000017
DOB:	11/02/1966	Encounter Date:	01/29/2025
Author:	Elena Morris, MD	Encounter:	Outpatient medical oncology

HISTORY OF PRESENT ILLNESS

Maya Rowan is seen after biopsy of a left breast primary and liver lesion confirmed metastatic breast carcinoma. Staging CT demonstrates liver and bone involvement. She reports mild fatigue but remains active and independent. No focal neurologic symptoms. ECOG performance status 1.

CURRENT CANCER THERAPY

- Letrozole 2.5 mg by mouth daily - planned start 02/03/2025
- Ribociclib 600 mg by mouth daily, days 1-21 of a 28-day cycle - planned start 02/03/2025

ASSESSMENT

De novo ER-positive/HER2-negative metastatic breast cancer involving liver and bone. Intent of systemic therapy is disease control. Baseline ECG and laboratory monitoring reviewed.

PLAN

1. Begin letrozole plus ribociclib as above after baseline laboratory review.
2. CBC/CMP every 2 weeks for the first two cycles, then per protocol.
3. Restaging CT chest/abdomen/pelvis in approximately 12 weeks.
4. Call for fever, infection symptoms, severe diarrhea, rash, palpitations, or other concerning symptoms.
